The general purpose timers embedded by the STM32 microcontrollers share the same backbone structure; they differ only on the level of features embedded by a given timer peripheral. The level of features integration for a given timer peripheral is decided based on the applications field that it targets. The timer peripherals can be classified as:

### AN4776 Application note - STMicroelectronics

The general-purpose timers consist of a 16-bit auto-reload counter driven by a programmable prescaler. Measuring the pulse lengths of input signals (input capture) Generating output waveforms (output compare, PWM) Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer

## STM32 Timer With Example - Work With Embedded Technology

General-Purpose STM32 Timers can generate an Interrupt/DMA signal on the following events: Update: counter overflow/underflow, counter initialization (by software or internal/external trigger) Trigger event (counter start, stop, initialization or count by internal/external trigger) Input capture; Output compare

## STM32 Timers Explained Tutorial - Timer Modes Examples ...

Typically most STM32 timers consist of a 16-bit auto reload counter and a 16-bit prescaler. The prescaler is responsible for dividing the incoming clock signal from a clock source as per our need. The auto-reload counter is loaded just we used to load timer registers of 8-bit MCUs. The only thing exceptional about it is its auto reloading feature.

Some of the STM32 timers feature up/down counting modes: the advanced control timers 1/8/20 and the general-purpose timers 2/3/4/5. The counting direction can be programmed by software or automatically managed by the timer in center-aligned PWM mode. In this mode, the counting direction changes automatically on counter overflow and underflow.
