Babbitt metal or bearing metal, is any of several alloys used for the bearing surface in a plain bearing. The original Babbitt alloy was invented in 1839 by Isaac Babbitt in Taunton, Massachusetts, United States. He disclosed one of his alloy recipes but kept others as trade secrets. Other formulations were developed later.

Babbitt (alloy) - Wikipedia

Babbitt is a white metal alloy that was patented by Isaac Babbitt in 1839. Over time, the term Babbitt has been applied to other similar white metals comprised of tin, copper and antimony. Lead can sometimes be added in place of the tin.

Babbitt metals are a group of white metal alloys that exhibit excellent bearing characteristics. They are mixtures of Tin (Sn), Copper (Cu), Antimony (Sb) and Lead (Pb). Some alloys contain small amounts of other metals. They are named after Isaac Babbitt, who was granted the first patent for such a mixture in 1839.

1.1 This specification covers eight typical white metal bearing alloys, in bar or ingot form, known commercially as “babbitt metal.” The alloys are specified, covering the range commercially used, and are designated by the alloy numbers shown in Table 1. 1.2 The values stated in inch-pound units are to be regarded as standard.

Standard Specification for White Metal Bearing Alloys ...

Babbitt metal, also called white metal, is a soft, white non-ferrous alloy used to provide a bearing surface. It has properties that help reduce friction which make it a good material to use in a plain bearing. Babbitt was first created by Isaac Babbitt. Born July 26, 1799 in Taunton, Massachusetts, Babbitt was well known as an inventor by trade.

An alloy is a mixture of metals, or a mixture of metal and another element. White metal alloys are those which are light-coloured and generally have a lead or tin base. These alloys are also known as Babbitt metal, or bearing metal, a term which is generally preferred over ‘white metals’.

BABBITT METAL - WHAT IS IT AND WHAT DO WE USE IT FOR?

Isaac Babbitt created the Babbitt metal in 1839. He was born in Taunton, Massachusetts on July 26, 1799. This soft, non-ferrous, white alloy later became used to produce the bearing surface. Its properties helped reduce friction.

Bismuth is a white, brittle metal with a slight pink color and is typically recovered as a by-product of lead and copper. It is commonly used as an alloying element for various low melting alloys where it is mixed with other metals such as Lead, Tin, or Cadmium. It is also used as well for a lead substitute in other materials.

Bearing Alloys Because of the relatively low melting point of bearing metal alloys, it is easy to convert ingots to liquid alloy. To make molten metal suitable for casting, however, requires careful control. The melting pot can be of any size suitable for the amount of metal needed. Heat-resistant iron containing nickel, chromium or

Babbitt Bearing Alloys - Maintenance

Tin-based Babbitt alloys are used to line most modern high speed engine and equipment bearings. When refurbishing a bearing surface, the rule of thumb is to use the same formula as the original design specification. If you’re unsure of the alloy, Kapp Alloy can analyze a sample to match the original formula.
